Problem 1. TODO ◁

Solution.

(a) This problem is straightforward.

$$\begin{aligned}
\overline{\mathcal{F}(\phi)(y)} &= \overline{\int_{\mathbb{R}^n} e^{-ix\cdot y}\phi(x)dx} \\
&= \int_{\mathbb{R}^n} \overline{e^{-ix\cdot y}\phi(x)}dx \\
&= \int_{\mathbb{R}^n} e^{ix\cdot y}\overline{\phi(x)}dx \\
&= (2\pi)^n(2\pi)^{-n}\int_{\mathbb{R}^n} e^{ix\cdot y}\overline{\phi(x)}dx \\
&= (2\pi)^n\mathcal{F}^{-1}\overline{\phi}(y)
\end{aligned}$$

This is what we wanted to show. □

(b) We know the Fourier inversion formula holds for Schwartz functions. By part (a) and the equation about interchanging fourier transform under the integral that we saw in class, we know

$$\begin{aligned}
(2\pi)^{-n}\int_{\mathbb{R}^n} \hat{\phi}\overline{\hat{\psi}} &= \int_{\mathbb{R}^n} \hat{\phi}\check{\overline{\psi}} \\
(2\pi)^{-n}\int_{\mathbb{R}^n} \hat{\phi}\overline{\hat{\psi}} &= \int_{\mathbb{R}^n} \check{\hat{\phi}}\hat{\check{\overline{\psi}}} \\
(2\pi)^{-n}\int_{\mathbb{R}^n} \hat{\phi}\overline{\hat{\psi}} &= \int_{\mathbb{R}^n} \phi\overline{\psi}.
\end{aligned}$$

Setting $\psi = \phi$, we see that

$$\int_{\mathbb{R}^n} \left|\hat{\phi}\right|^2 = (2\pi)^2\int_{\mathbb{R}^n} |\phi|^2,$$

as we wanted. □

Problem 2. TODO $\triangleleft$

Solution.

(a) Let $\tilde{u}(t,x)$ be defined as in the problem. On $(0,+\infty)\times(0,+\infty)$, $\tilde{u}$ is the same as u, so it satisfies the equation $\tilde{u}_t = \tilde{u}_{xx}$. On $(0,+\infty)\times(-\infty,0)$, we see that

$$\tilde{u}_t(t,x) = -u_t(t,-x) = -u_{xx}(t,-x) = \tilde{u}_{xx}(t,x).$$

So, $\tilde{u}_t = \tilde{u}_{xx}$ on all of $(0,+\infty)\times(0,+\infty)\cup(0,+\infty)\times(-\infty,0)$ and is C^2 there. Now, consider the points along $x=0$. We can define $\tilde{u}(t,0)=0$. We see that

$$\lim_{x\to 0} u(t,x) = u(t,0) = 0,$$

and thus $\lim_{x\to 0}\tilde{u}(t,x) = 0$ from both sides, and is equal to $\tilde{u}(t,0)$. So, $\tilde{u}$ is continuous in $[0,+\infty)\times\mathbb{R}$.

Now, let's consider differentiability. Let $t>0$. We see that

$$\begin{aligned}\lim_{h\to^+0}\frac{\tilde{u}(t,h)-\tilde{u}(t,0)}{h} &= \lim_{h\to^+0}\frac{\tilde{u}(t,h)}{h}\\ &= \lim_{h\to^+0}\frac{u(t,h)}{h}\\ &= \lim_{h\to^-0}\frac{u(t,-h)}{-h}\\ &= \lim_{h\to^-0}\frac{\tilde{u}(t,h)}{h}.\end{aligned}$$

Thus, the derivative from both sides matches up. We see that $\tilde{u}_t(t,0)=0$. Since u is continuously differentiable on the border, both components of the derivative are continuous, so u is differentiable on $(0,+\infty)\times\mathbb{R}$.

We can now assume that $\tilde{u} = K_t * \tilde{g}$. Writing this out, we have

$$\tilde{u} = K_t$$
