MATH 173 PROBLEM SET 9

Stepan (Styopa) Zharkov

June 1, 2022

Problem 1. Solution. Recall that we defined $G(x,y)=E(x-y)-\phi^x(y)$ where $\Delta\phi^x=0$ and $\phi^x|_{\partial\Omega}=E(x-\cdot).$ So, if $Q(x,y):=G(x,y)-E(x-y)=-\phi^x(y),$ then $Q|_{\partial(\Omega\times\Omega)}=-E(x-y)$ and $\Delta Q=0.$ So, by the maximum principle, the minimum is achieved on the boundary. But the boundary is nonnegative, so Q>0, so $G(x,y)\geq E(x-y).$

Problem 2.

Solution.

(a) We need $\int_0^1 |x^{\alpha}|^2 = \int_0^1 x^{2\alpha}$ to converge. This converges for $\alpha > -1/2$ and diverges for $\alpha \leq -1/2$, so $\phi_{\alpha} \in L^2((0,1))$ for $\alpha > -1/2$.

(b) We need $\phi_{\alpha} \in L^2((0,1))$, so $\alpha > -1/2$. But, since ϕ_{α} are smooth, we also need $\int_0^1 |\phi_{\alpha}'|^2$ to converge. We see $\phi_{\alpha}' = \alpha x^{\alpha-1}$. and $\int_0^1 |\alpha x^{\alpha-1}|^2 = |\alpha|^2 \int_0^1 x^{2(\alpha-1)}$ converges for $\alpha > 1/2$ and diverges for $\alpha \le 1/2$. So, $\phi_{\alpha} \in H^1((0,1))$ for $\alpha > 1/2$.

Problem 3.

Solution.

(a) We know the statement is true for $f \in C^1((a,b))$ by FTC. Now, let $f_n \to f$ where $f_n \in C^1((a,b))$. By the continuity of the trace operator,

$$f(y) - f(x) = \lim_{n \to \infty} (f_n(y) - f_n(x)) = \lim_{n \to \infty} \int_x^y f'_n(t)dt$$

Now, since we are on a bounded interval, we can move the limit inside the derivative after applying dominated convergence to see that

$$\lim_{n\to\infty} \int_x^y f_n'(t)dt - \int_x^y f_n'(t)dt = \lim_{n\to\infty} \int_x^y (f_n(t) - f(t))'dt = 0.$$

So,

$$f(y) - f(x) = \int_{x}^{y} f'(t)dt$$

as we wanted.

(b) By Cauchy-Schwartz and part (a) and that |f'| is bounded by C,

$$|f(y) - f(x)|^2 = |\int_x^y f'(t)dt|^2$$

$$\leq \int_x^y |f'(t)|^2 dt$$

$$\leq \int_x^y C^2 dt$$

$$= |y - x|C^2.$$

So,
$$|f(x) - f(y)| \le C|x - y|^{1/2}$$
.

Problem 4.

Solution. First, note that for $f \in C^1((a,b))$ where f(a) = f(b) = 0, and any $x \in (a,b)$, we have by Cauchy Schwartz,

$$2||f||_{2}||f'||_{2} = 2\left(\int_{a}^{b}|f(t)|^{2}\right)^{1/2}\left(\int_{a}^{b}|f'(t)|^{2}\right)^{1/2}$$

$$\geq 2\int_{a}^{b}|f(t)f'(t)|dt$$

$$\geq 2\int_{a}^{x}|f(t)f'(t)|dt$$

$$\geq \left|\int_{a}^{x}2f(t)f'(t)dt\right|$$

$$= \left|\int_{a}^{x}(f(t)^{2})'dt\right|$$

$$= |f(x)^{2} - f(a)^{2}|$$

$$= |f(x)^{2}|.$$

Since x was arbitrary,

$$\sup_{(a,b)} |f(x)|^2 \le 2||f||_2||f'||_2.$$

Now, problem 3(b) and the fact that $H_0^1((a,b)) \subseteq H^1((a,b)) \subseteq C([a,b])$ gives us the same inclusion argument as in chapter 9.1, leading us to conclude the statement for all $f \in H^1((a,b))$.

Problem 5.

Solution. Consider the dogbowl functions

$$f_n := 1 - \min(n \cdot d(x, \partial B), 1).$$

We see that $Tf_n = 1$ for all n, so $Tf_n \to 1 \neq 0$. However,

$$||f_n||_{L_2}^2 = \int_B |f_n(x)|^2 dx = \int_{d(x,\partial B)<1/n} |f_n(x)|^2 dx \le \int_{d(x,\partial B)<1/n} 1 dx = O(1/n) \to 0.$$

So,
$$f_n \to 0$$
 in L^2 .

Problem 6.

Solution. Let $u = \lim_{n \to \infty} u_n$ where u_n are compactly supported continuous functions. Note that we are given that $u = \lim_{n \to \infty} -u_n(x^*)$. This means that

$$u = \frac{\lim_{n \to \infty} u_n(x) + \lim_{n \to \infty} - u_n(x^*)}{2} = \lim_{n \to \infty} \frac{u_n(x) - u_n(x^*)}{2}.$$

Note that $\frac{u_n(x)-u_n(x^*)}{2}=0$ when $x_n=0$, so

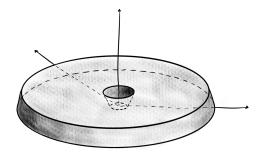

$$T_{B_+}\left(\frac{u_n(x)-u_n(x^*)}{2}\right) = \frac{u_n(x)-u_n(x^*)}{2}|_{\partial B_+} = 0.$$

We have shown in class that this is sufficient to say $T_{B_+}(u|_{B_+})=0$, so $u|_{B_+}\in H^1_0(B_+)$.

Problem 7.

Solution.

(a) Let $V_k = \{x : |x| < 1/k\}$ and let $W_k = \{x : 1 - 1/k < |x| < 1\}$. Then, consider lemonsqueezer functions $f_k \in \text{such that } f \in C_0^1(U) \text{ and } f_k|_{B(V_k \cap W_k)} = 1 \text{ and } f_k|_{V_{2k} \cup W_{2k}} = 0 \text{ with } O(k) \text{ derivatives.}$

Note that $u_k := uf_k \in C_0^1(U)$. We claim $u_k \to u$ in $H^1(B)$. Note that

$$||u - u_k||_{H^1}^2 = \int_B |u - u_k|^2 + \int_B |\nabla u - \nabla u_k|^2.$$

Now, since u is bounded

$$\int_{B} |u - u_{k}|^{2} = \int_{B} |u|^{2} |1 - f_{k}|^{2}$$

$$= \int_{B} O(1) |1 - f_{k}|^{2}$$

$$= O(1) \int_{B} |1 - f_{k}|^{2}$$

$$= O(1) \int_{V_{k} \cup W_{k}} |1 - f_{k}|^{2}$$

$$= O(1) \int_{V_{k} \cup W_{k}} O(1)$$

$$= O(1/k^{n}) = o(1)$$

where the asymptotic notation is with respect to k. Also,

$$\int_{B} |\nabla u - \nabla u_{k}|^{2} = \int_{B} |\nabla u - \nabla u f_{k} - u \nabla f_{k}|^{2} \le 2 \int_{B} |\nabla u|^{2} |1 - f_{k}|^{2} + 2 \int_{B} |u \nabla f_{k}|^{2}.$$

Note that since $|\nabla u|$ is bounded, applying our above logic to the first part gives us

$$2\int_{B} |\nabla u|^{2} |1 - f_{k}|^{2} = O(1) \int_{B} |1 - f_{k}|^{2} = o(1).$$

So, we only need to deal with the second part. We see that since u is bounded and ∇f_k is mostly
