MATH 173 Problem Set 9

Stepan (Styopa) Zharkov

June 1, 2022

Problem 1. ◁

Solution.

Problem 2.

Solution.

(a) We need $\int_0^1 |x^\alpha|^2 = \int_0^1 x^{2\alpha}$ to converge. This converges for $\alpha > -1/2$ and diverges for $\alpha \leq -1/2$, so $\phi_\alpha \in L^2((0,1))$ for $\alpha > -1/2$. □

(b) We need $\phi_\alpha \in L^2((0,1))$, so $\alpha > -1/2$. But, since ϕ_α are smooth, we also need $\int_0^1 |\phi'_\alpha|^2$ to converge. We see $\phi'_\alpha = \alpha x^{\alpha-1}$. and $\int_0^1 |\alpha x^{\alpha-1}|^2 = |\alpha|^2 \int_0^1 x^{2(\alpha-1)}$ converges for $\alpha > 1/2$ and diverges for $\alpha \leq 1/2$. So, $\phi_\alpha \in H^1((0,1))$ for $\alpha > 1/2$. □

Problem 3.　　　　　　　　　　　　　　　　　　　　　　　　　　　　◁

Solution.

(a) We know the statement is true for $f \in C^1((a,b))$ by FTC. Now, let $f_n \to f$ where $f_n \in C^1((a,b))$. By the continuity of the trace operator,

$$f(x) - f(y) = \lim_{n \to \infty} (f_n(x) - f_n(y)) = \lim_{n \to \infty} \int_x^y f_n'(t)dt$$

TODO: finish this.

(b) TODO

Problem 4.   ◁

Solution.

Problem 5.

Solution. Consider the dogbowl functions

$$f_n := 1 - \max(n \cdot d(x, \partial B), 1).$$

TODO: image

We see that $Tf_n = 1$ for all $n4$, so $Tf_n \to 1 \neq 0$. However,

$$||f_n||_{L_2}^2 = \int_B |f_n(x)|^2 dx = \int_{d(x, \partial B) < 1/n} |f_n(x)|^2 dx \leq \int_{d(x, \partial B) < 1/n} 1 dx = O(1/n) \to 0.$$

So, $f_n \to 0$ in L^2. $\qquad \square$

Problem 6.

Solution. Let $u = \lim_{n \to \infty} u_n$ where u_n are compactly supported continuous functions. Note that we are given that $u = \lim_{n \to \infty} - u_n(x^*)$. This means that

$$u = \frac{\lim_{n \to \infty} u_n(x) + \lim_{n \to \infty} - u_n(x^*)}{2} = \lim_{n \to \infty} \frac{u_n(x) - u_n(x^*)}{2}.$$

Note that $\frac{u_n(x) - u_n(x^*)}{2} = 0$ when $x_n = 0$, so

$$T_{B_+} \left(\frac{u_n(x) - u_n(x^*)}{2} \right) = \frac{u_n(x) - u_n(x^*)}{2} \Big|_{\partial B_+} = 0.$$

We have shown in class that this is sufficient to say $u \in H^1_0(B_+)$

Problem 7.   ◁

Solution.
